

**Spring 2022**

# INTRODUCTION TO COMPUTER VISION

---

**Atlas Wang**

Assistant Professor, The University of Texas at Austin

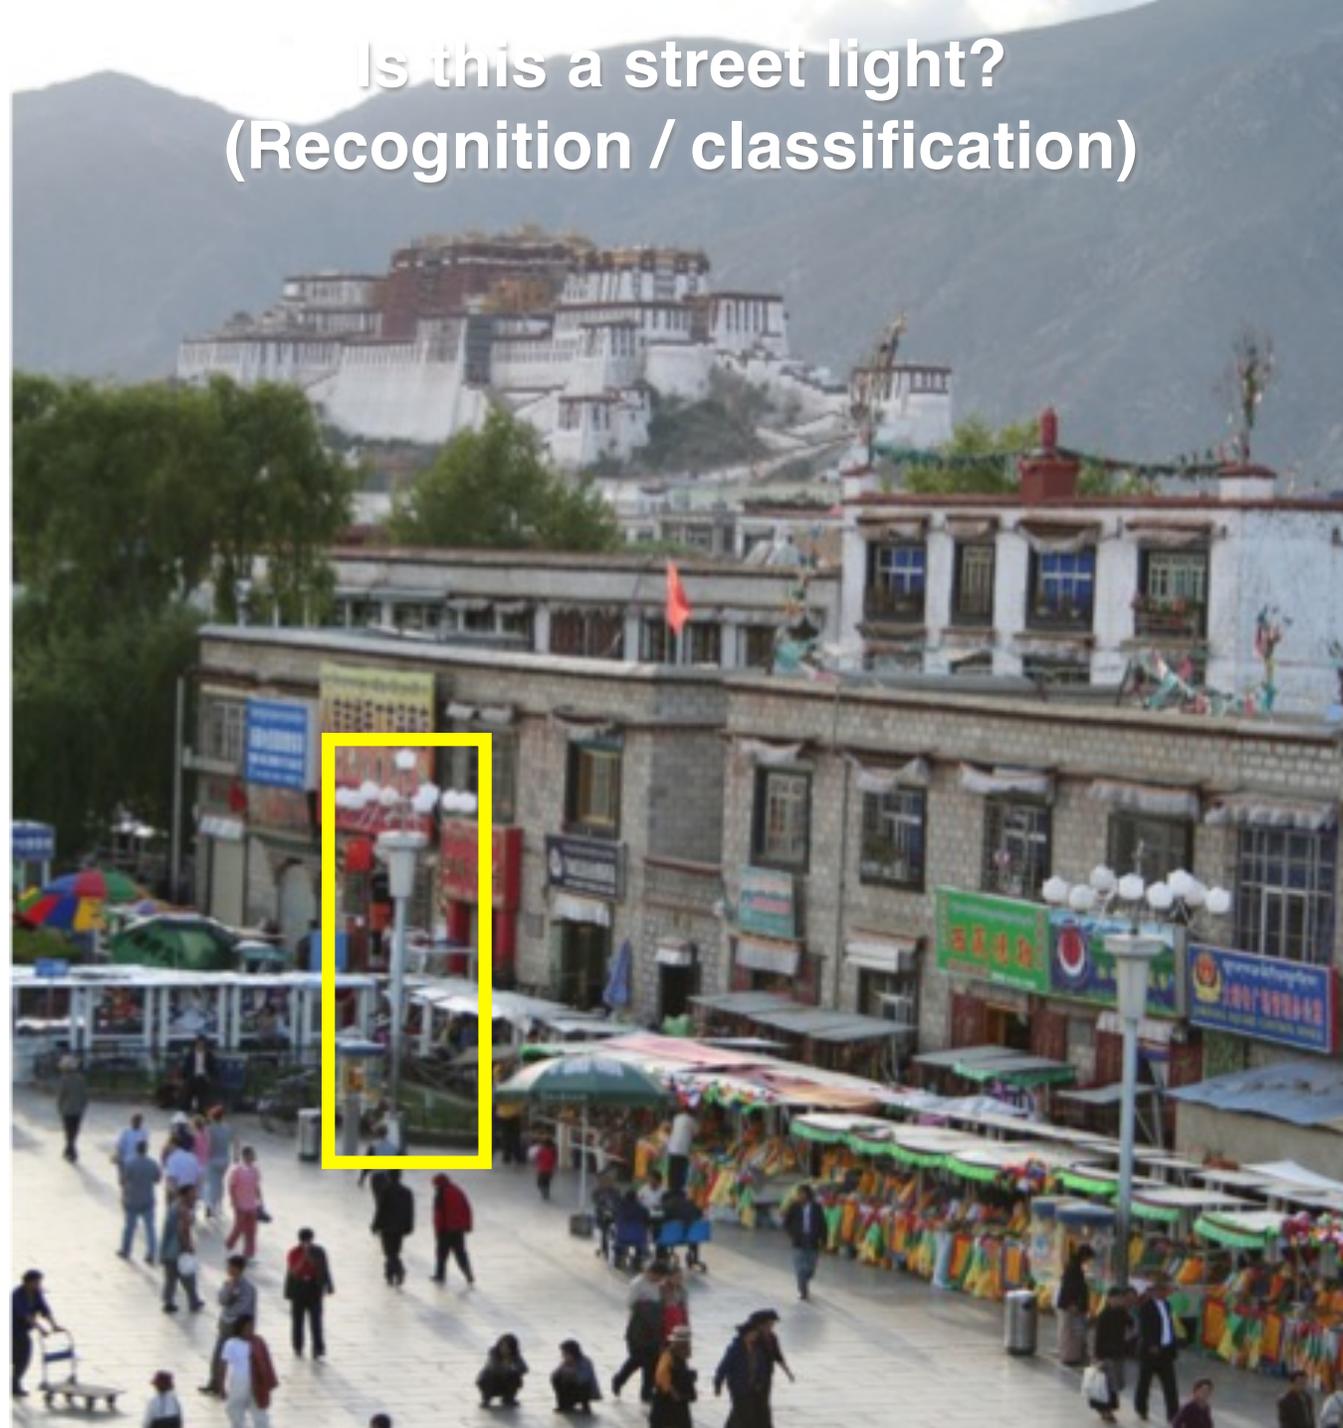

**Visual Informatics Group@UT Austin**

<https://vita-group.github.io/>

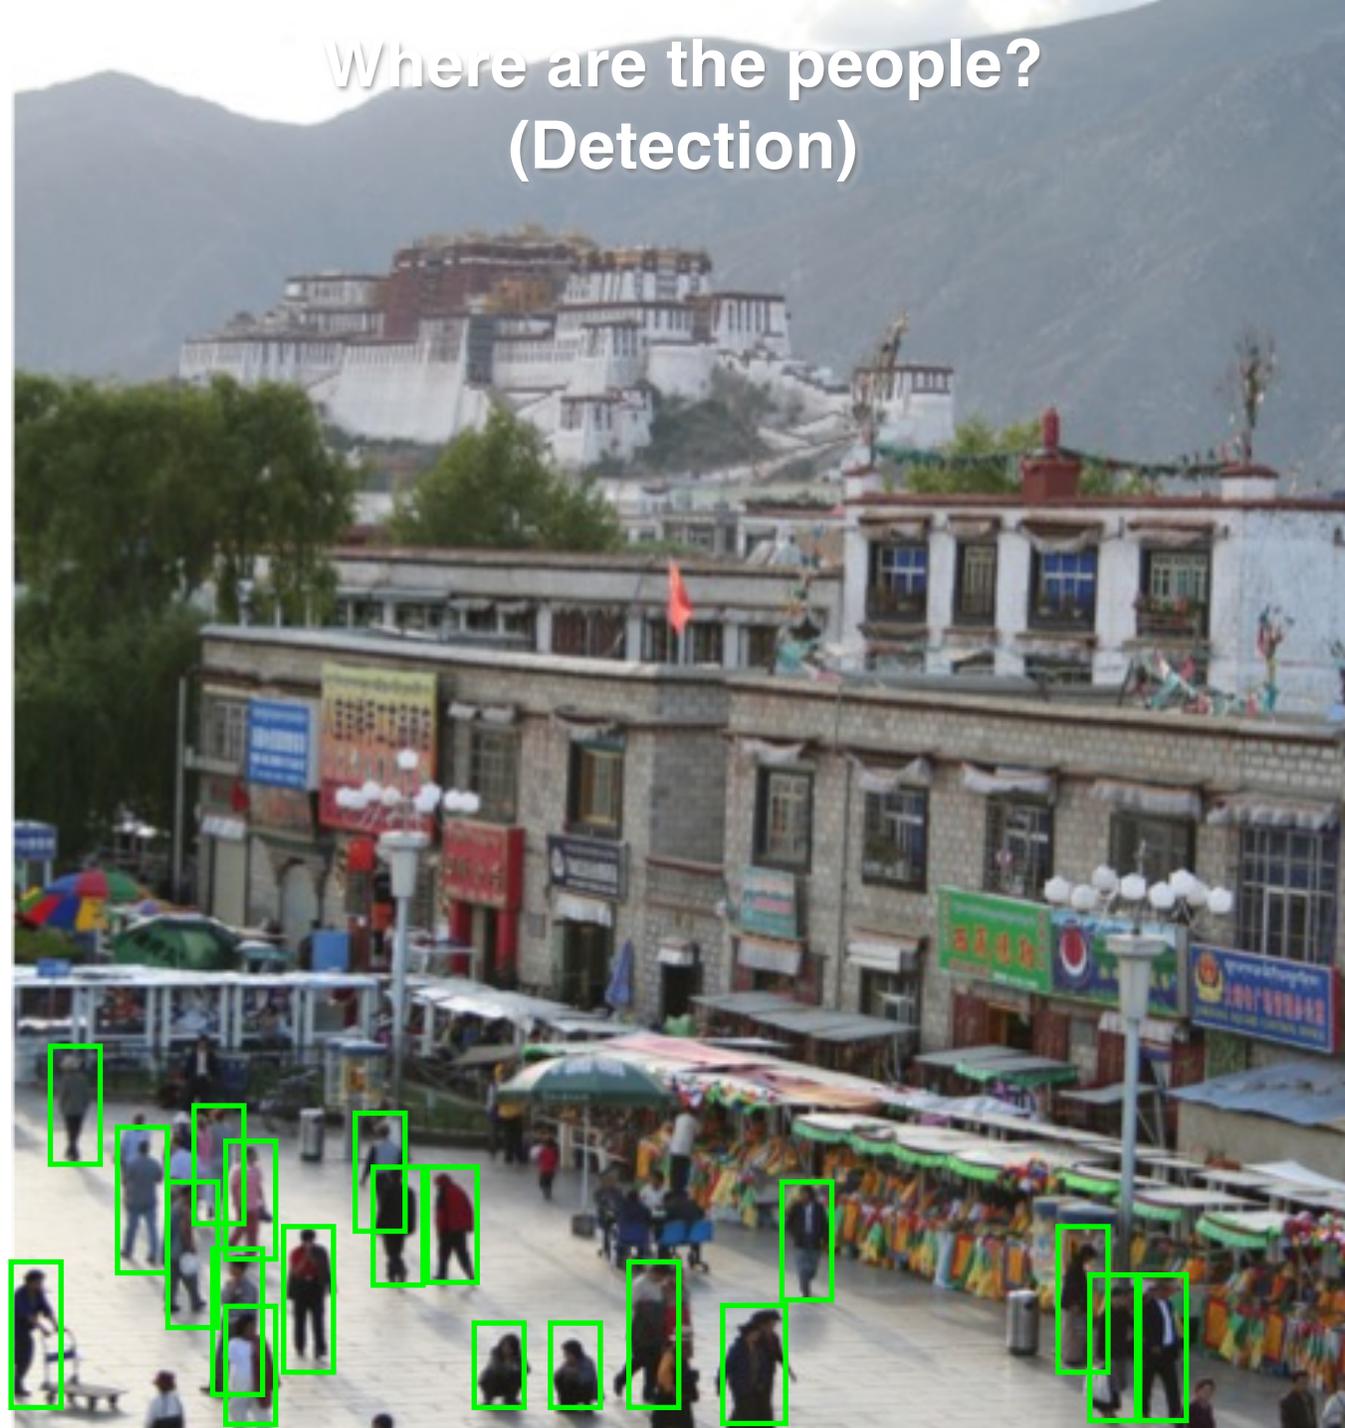

What do we mean by learning-based vision or “semantic vision”?

---

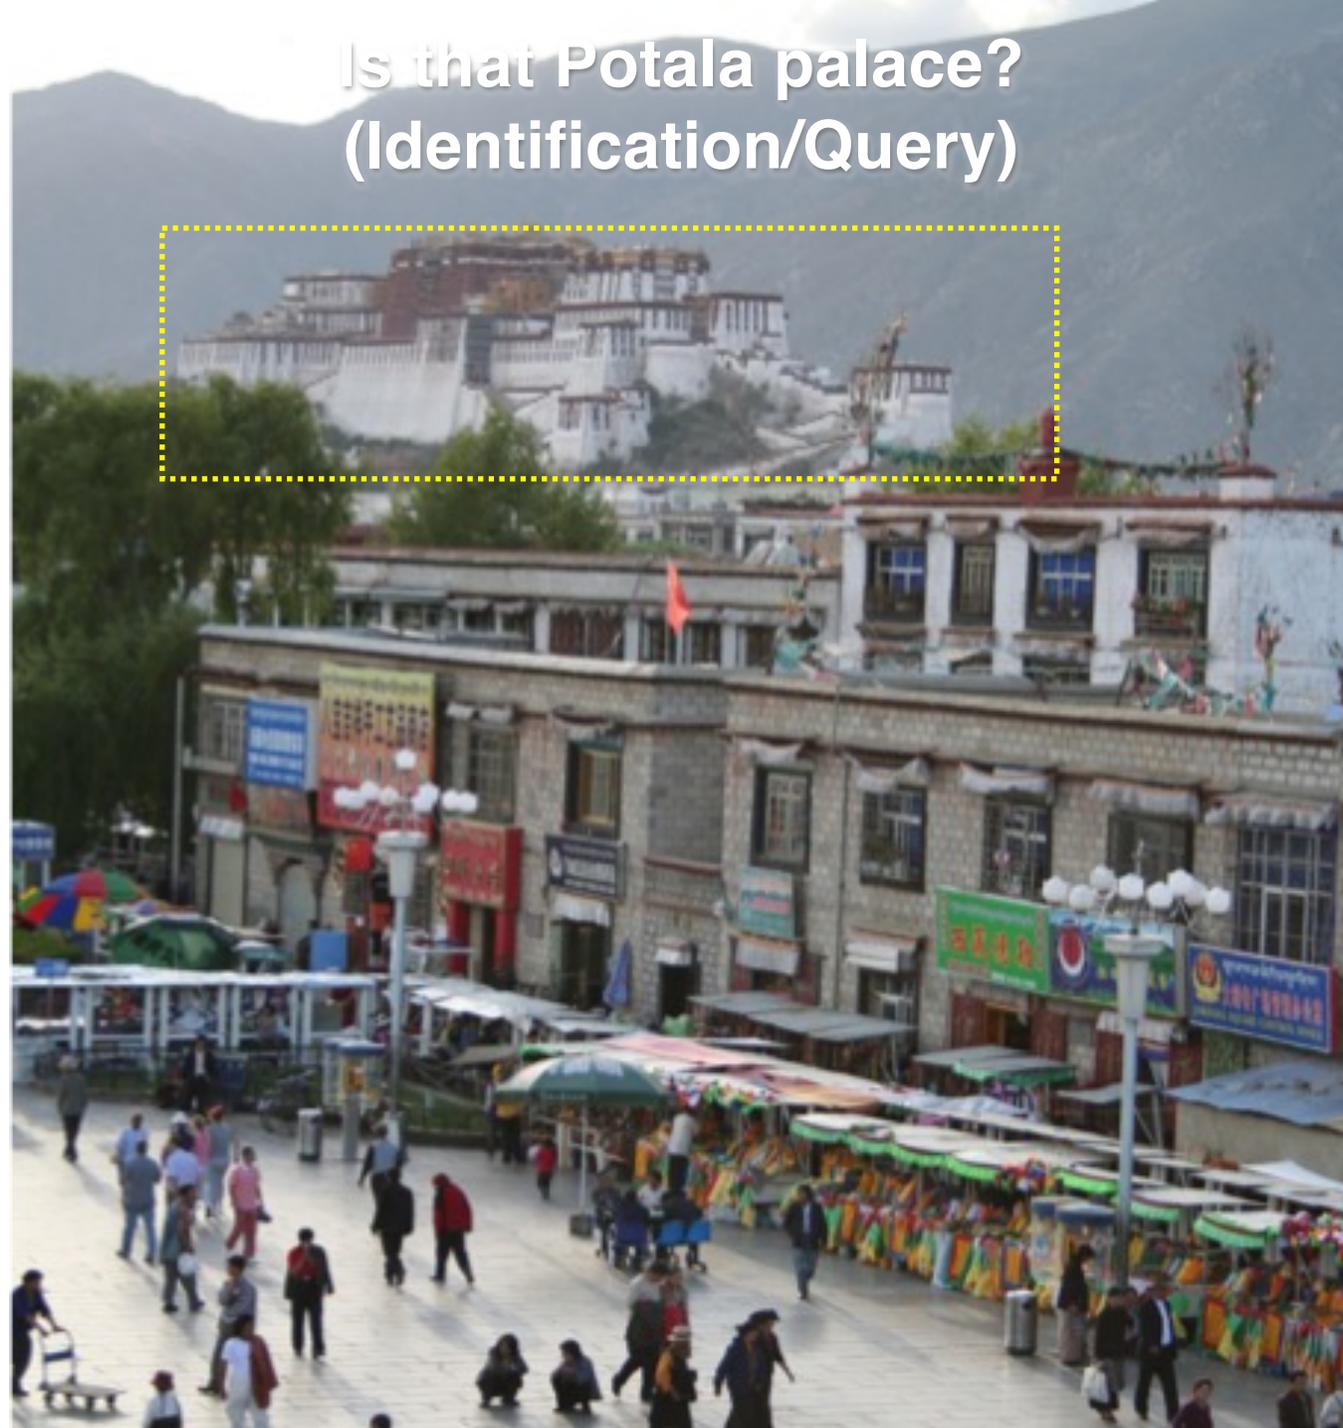

Is this a street light?  
(Recognition / classification)

# Where are the people? (Detection)

Is that Potala palace?  
(Identification/Query)

**Sky**

# What's in the scene? (semantic segmentation)

**Mountain**

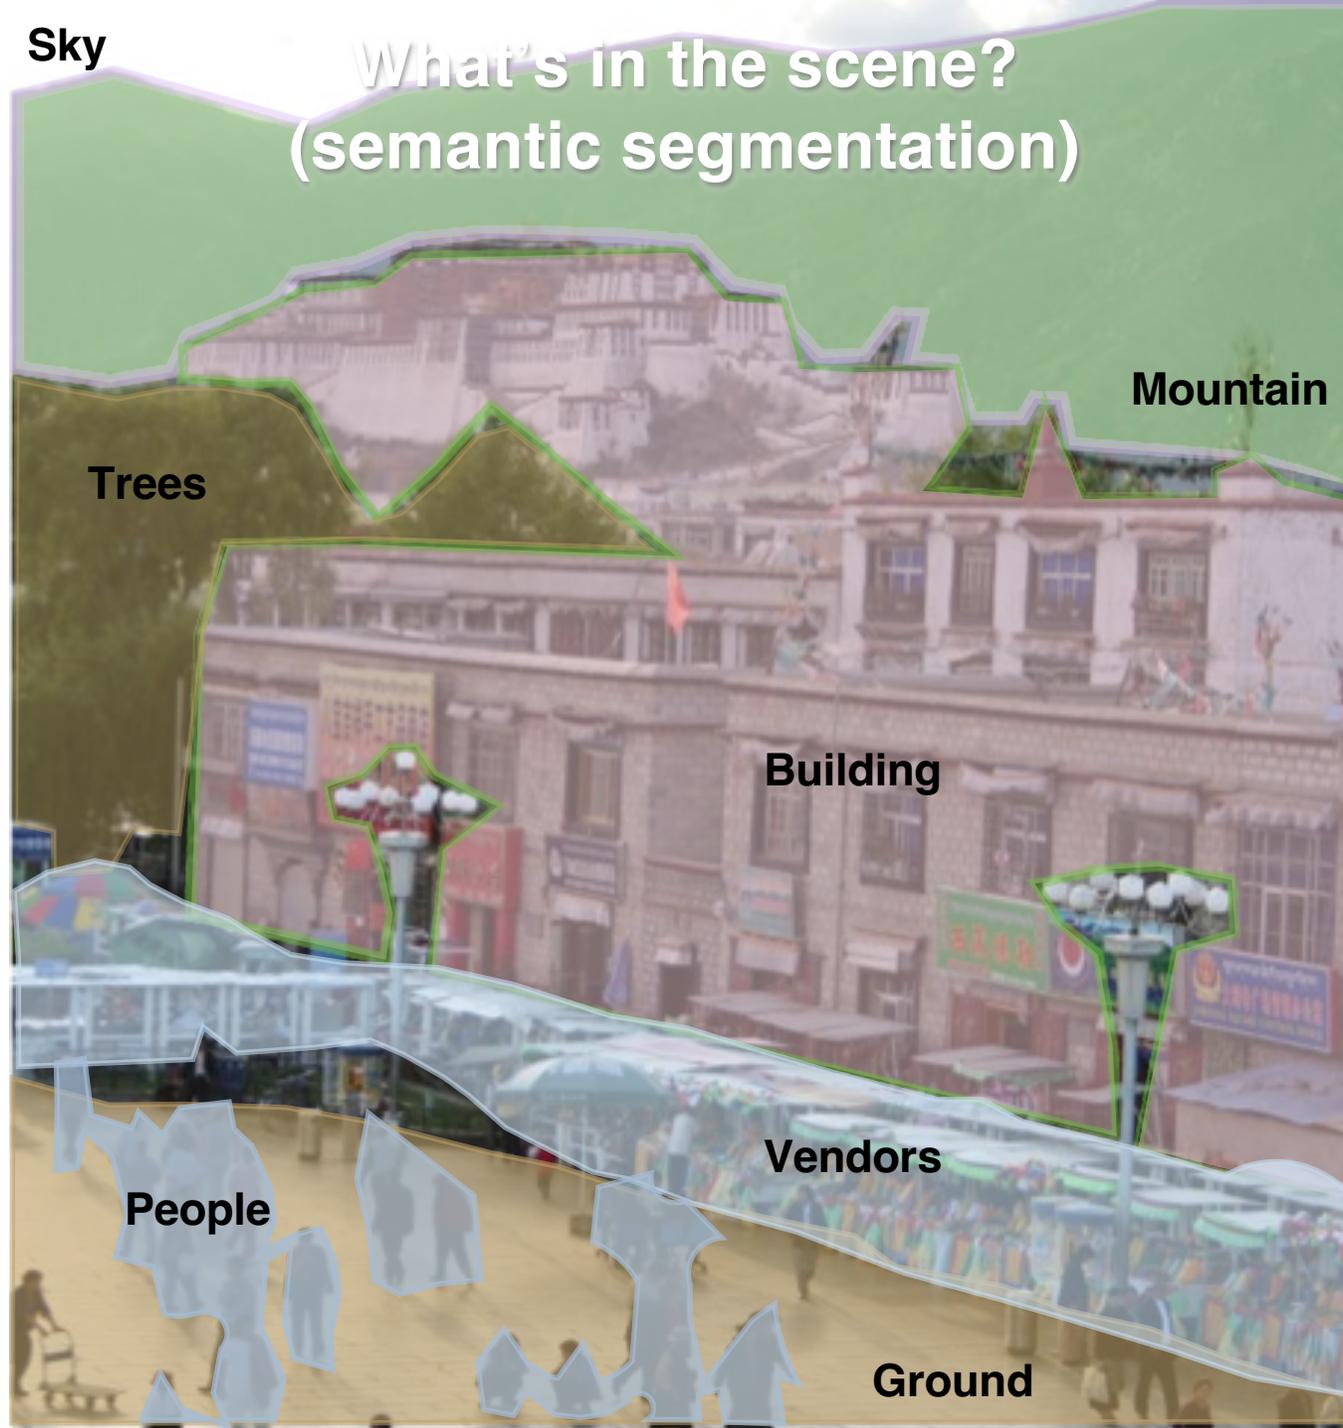

**Trees**

**Building**

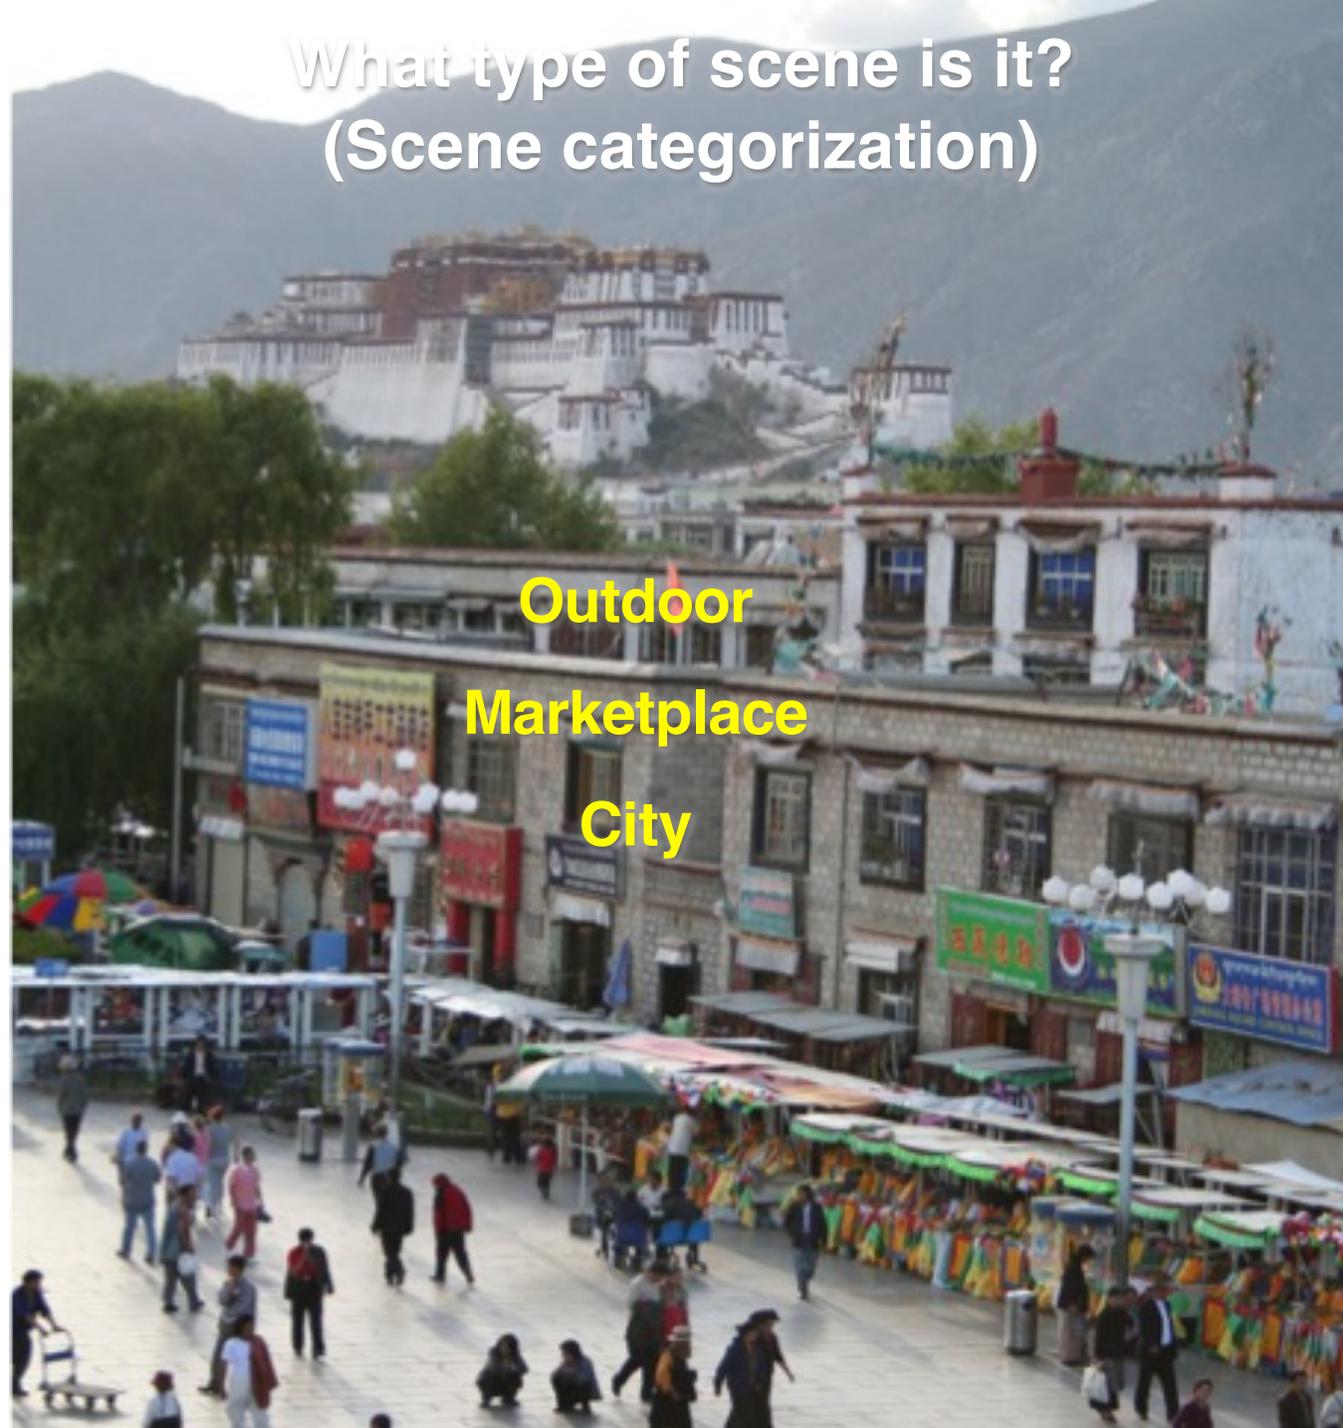

**Vendors**

**People**

**Ground**

What type of scene is it?  
(Scene categorization)

Outdoor

Marketplace

City

# Activity / Event Recognition

# Object recognition

## Is it really so hard?

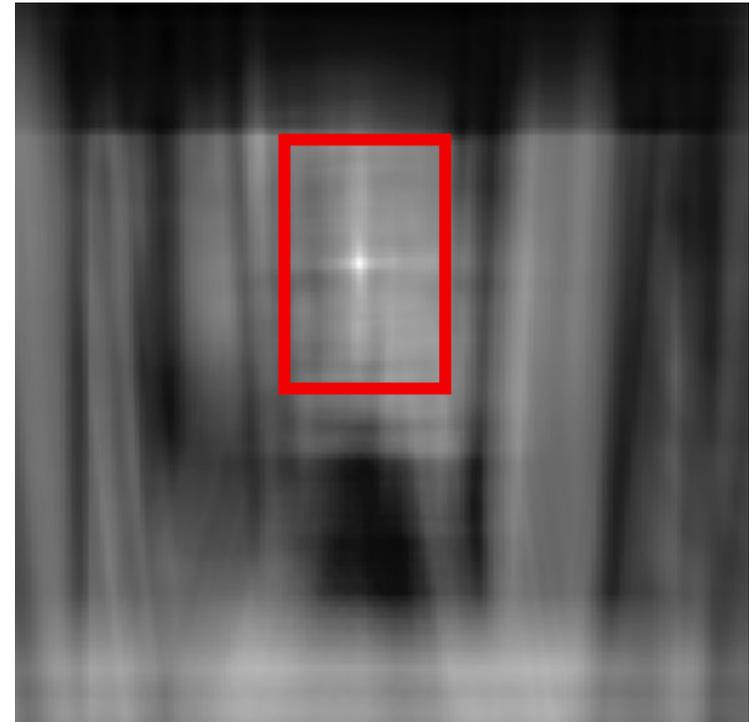

This is a chair

Find the chair in this image

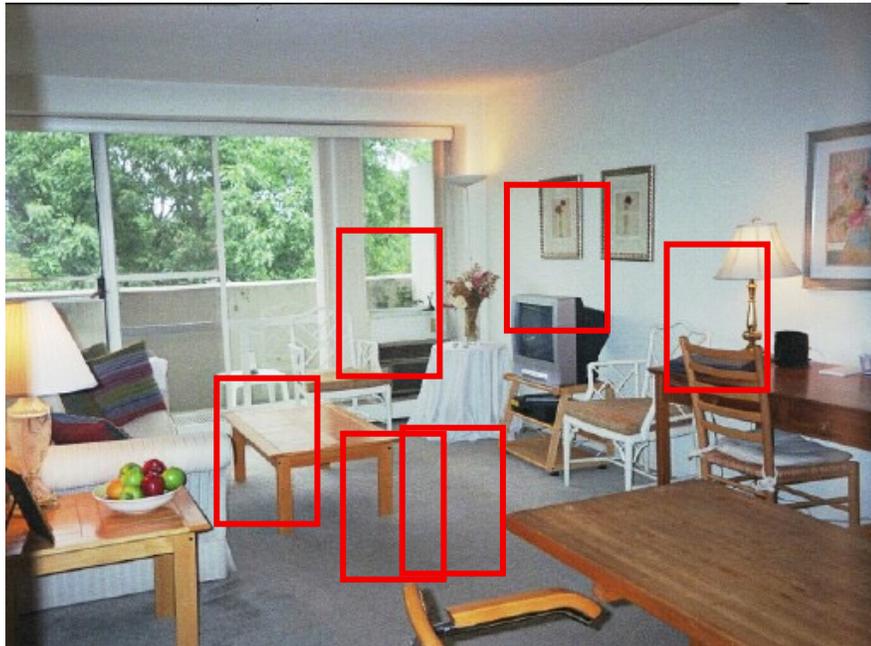

Output of normalized correlation

# Object recognition

## Is it really so hard?

Find the chair in this image

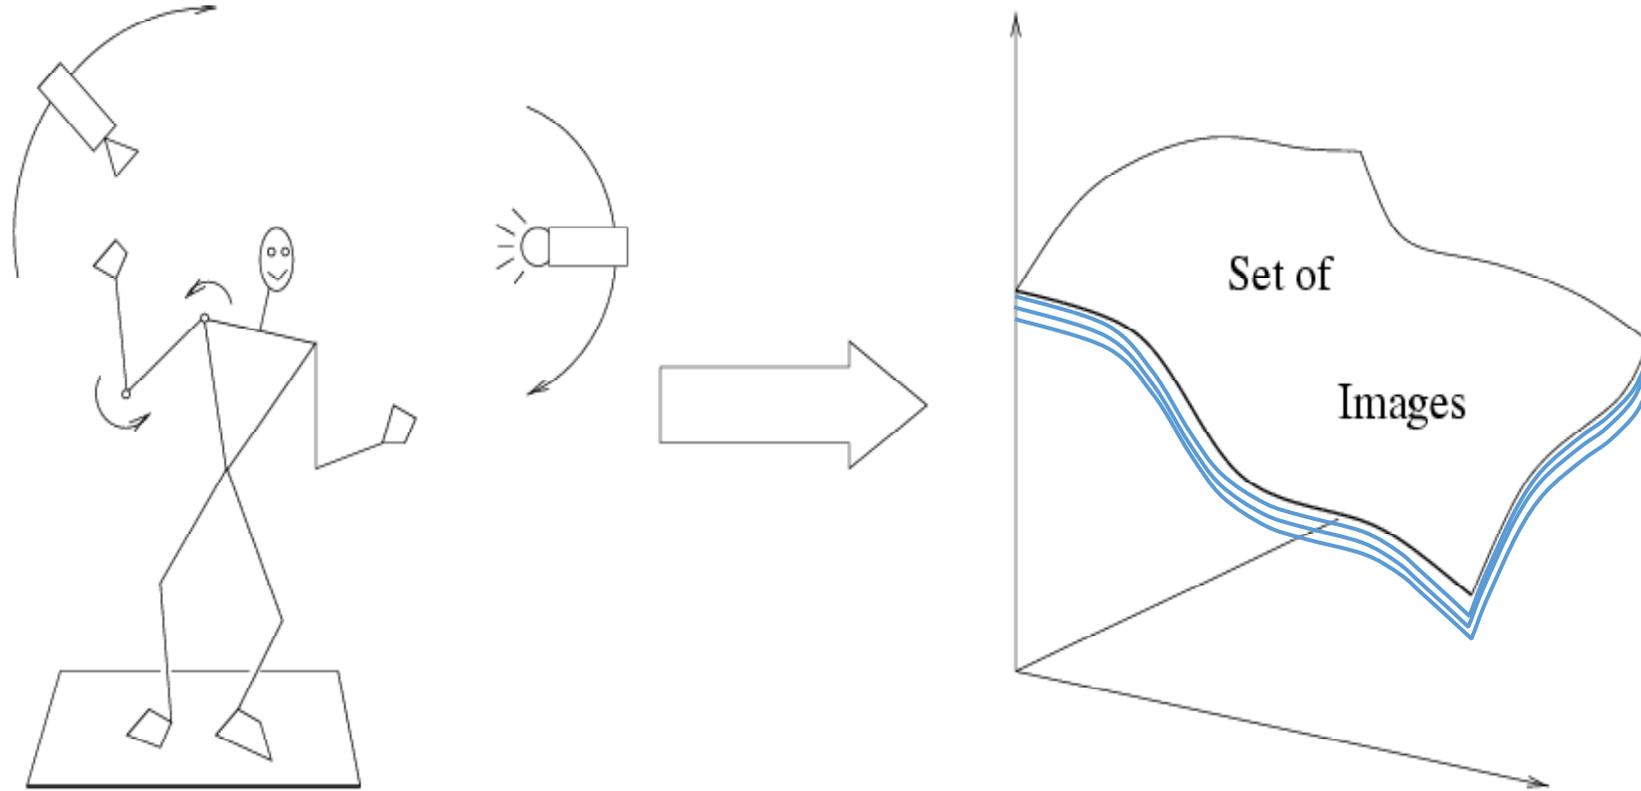

Pretty much garbage

Simple template matching is not going to make it

A “popular method is that of template matching, by point to point correlation of a model pattern with the image pattern. These techniques are inadequate for three-dimensional scene analysis for many reasons, such as occlusion, changes in viewing angle, and articulation of parts.” Nivatia & Binford, 1977.

# Why is this hard?

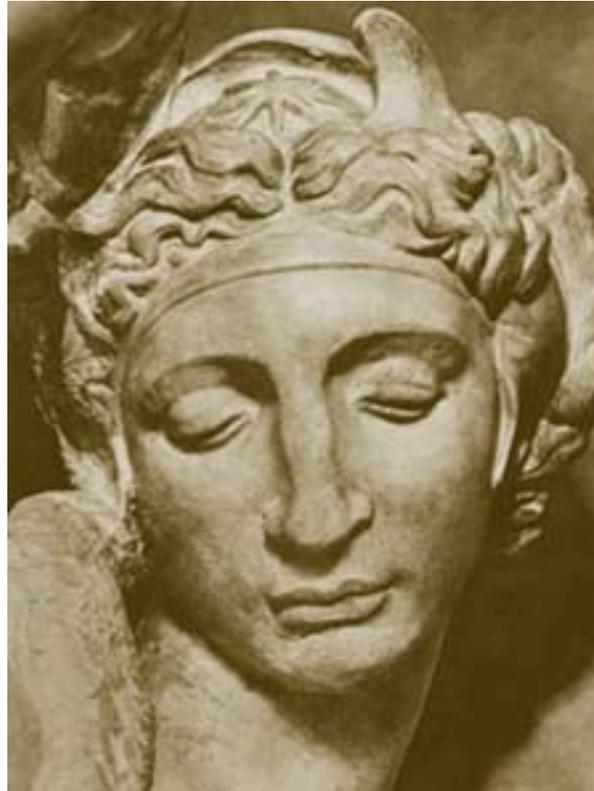

**Variability:** Camera position  
Illumination  
Shape parameters

# How many object categories are there?

~10,000 to 30,000

# Challenge: variable viewpoint

Michelangelo 1475-1564

# Challenge: variable illumination

What the computer sees

image classification → 82% cat  
15% dog  
2% hat  
1% mug

# Data-driven approach

- Collect a database of images with labels
- Use ML to train an image classifier
- Evaluate the classifier on test images

Example training set

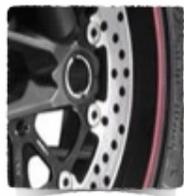

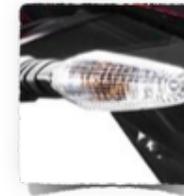

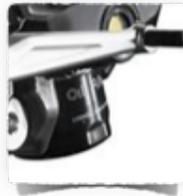

# History of Image Classification

- 1960s –early 1990s: the geometric era
  - Recognition as an alignment problem: the simple “toy block” world ...
- 1990s: appearance-based models
  - PCA (eigenface), color histogram ...
- Mid-1990s: sliding window/template approaches
- Late 1990s: local features
- Early 2000s: parts-and-shape models
- **Mid-2000s: bags of features (Today)**
- *Present trends: deep learning (we will get there)*

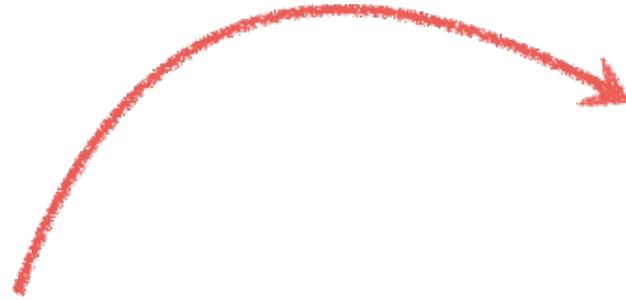

A photograph of two reusable shopping bags filled with fresh produce. In the foreground, a white canvas bag is overflowing with green leafy vegetables. Behind it, a brown canvas bag contains several oranges and lemons. The bags are placed on a tiled floor in front of a wooden door. A colorful doormat with the word 'WELCOME' is visible. The text 'Bag of words' is overlaid in the center of the image.

Bag of words

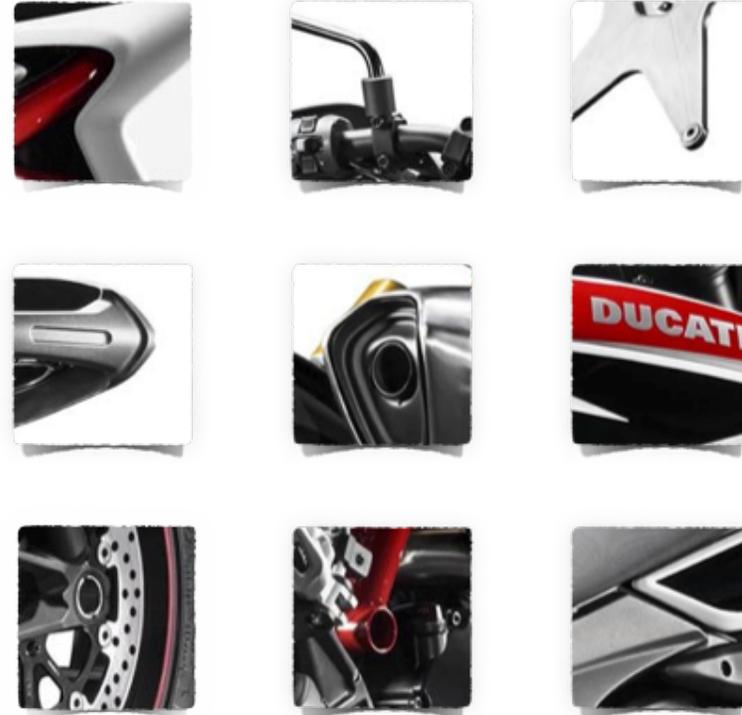

What object do these parts belong to?

Some local feature are very informative

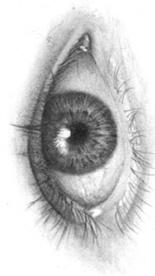

An object as

a collection of local features  
(bag-of-features)

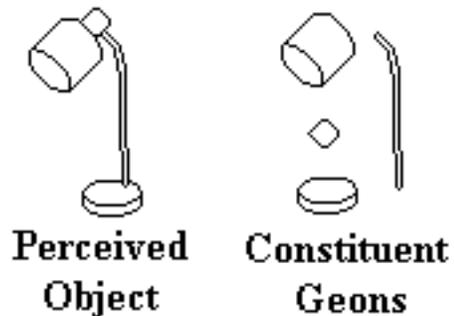

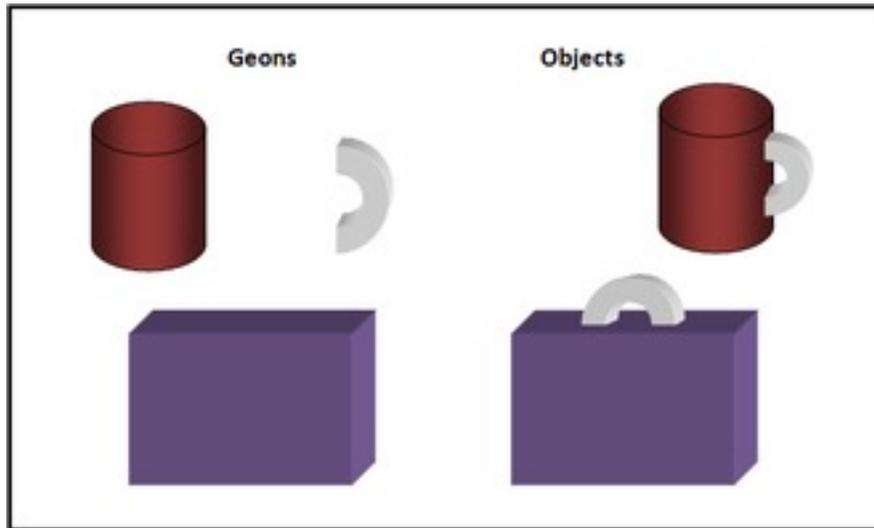

- deals well with occlusion
- scale invariant
- rotation invariant

# (not so) crazy assumption

spatial information of local features  
can be ignored for object recognition (i.e., verification)

# Recognition-by-Components (RBC) Theory (1987)

- A human learning theory to explain object recognition
- According to RBC theory, we are able to recognize objects by separating them into **geons** (the object's main component parts).
- Geons are based on basic 3-dimensional shapes (cylinders, cones, etc.) that can be assembled in various arrangements to form a virtually unlimited number of objects.
- **Very impactful for computer vision recognition!**

# Bag-of-features

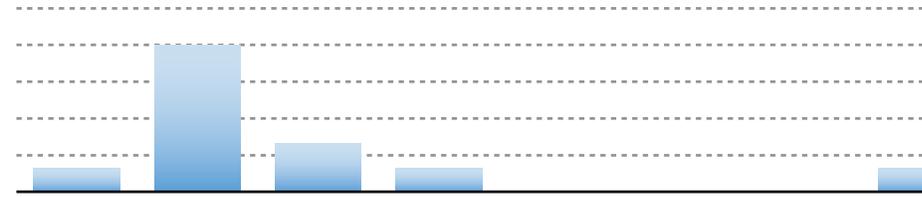

represent a data item (document, texture, image)  
as a histogram over features

an old idea

(e.g., texture recognition and information retrieval)

# Vector Space Model

G. Salton. 'Mathematics and Information Retrieval' Journal of Documentation, 1979

1	6	2	1	0	0	0	1
Tartan	robot	CHIMP	CMU	bio	soft	ankle	sensor

0	4	0	1	4	5	3	2
Tartan	robot	CHIMP	CMU	bio	soft	ankle	sensor

A document (datapoint) is a vector of counts over each word (feature)

$$\mathbf{v}_d = [n(w_{1,d}) \quad n(w_{2,d}) \quad \cdots \quad n(w_{T,d})]$$

$n(\cdot)$  counts the number of occurrences

just a histogram over words

What is the similarity between two documents?

A document (datapoint) is a vector of counts over each word (feature)

$$\mathbf{v}_d = [n(w_{1,d}) \quad n(w_{2,d}) \quad \cdots \quad n(w_{T,d})]$$

$n(\cdot)$  counts the number of occurrences

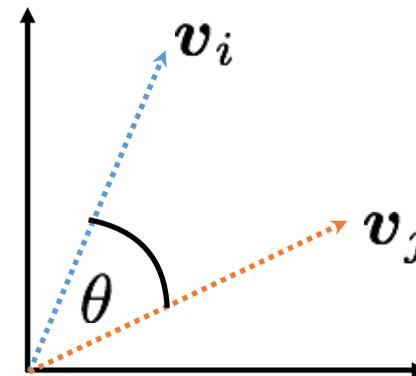

just a histogram over words

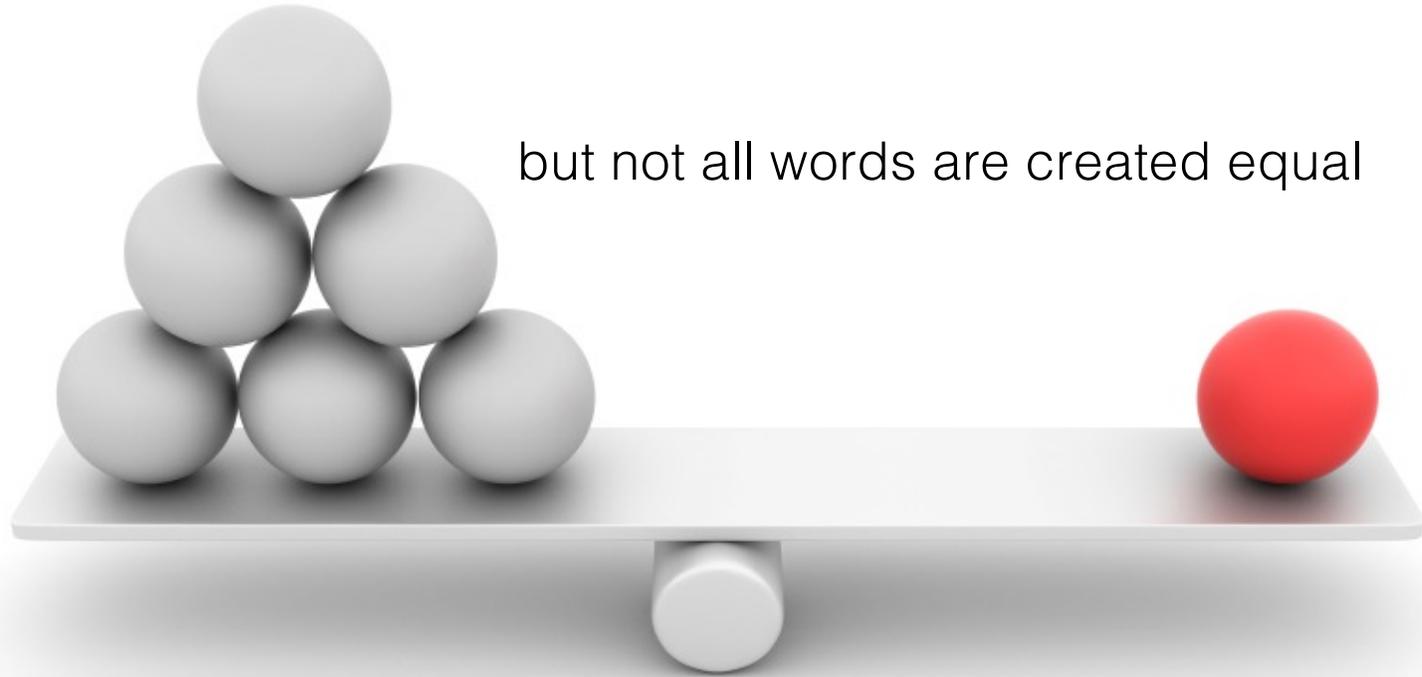

What is the similarity between two documents?

Use any distance you want but the cosine distance is fast.

$$d(\mathbf{v}_i, \mathbf{v}_j) = \cos \theta$$
$$= \frac{\mathbf{v}_i \cdot \mathbf{v}_j}{\|\mathbf{v}_i\| \|\mathbf{v}_j\|}$$

but not all words are created equal

# TF-IDF

Term **F**requency Inverse **D**ocument **F**requency

$$\mathbf{v}_d = [n(w_{1,d}) \quad n(w_{2,d}) \quad \cdots \quad n(w_{T,d})]$$

weigh each word by a heuristic

$$\mathbf{v}_d = [n(w_{1,d})\alpha_1 \quad n(w_{2,d})\alpha_2 \quad \cdots \quad n(w_{T,d})\alpha_T]$$

$$n(w_{i,d})\alpha_i = \underbrace{n(w_{i,d})}_{\text{term frequency}} \log \left\{ \frac{D}{\sum_{d'} \mathbf{1}[w_i \in d']} \right\}$$

inverse document frequency

(down-weights **common** terms)

# Standard BOW pipeline (for image classification)

## **Dictionary Learning:**

Learn Visual Words using clustering

## **Encode:**

build Bags-of-Words (BOW) vectors  
for each image

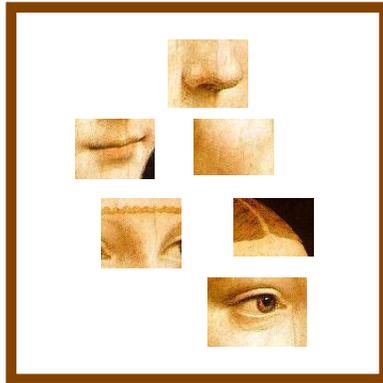

## **Classify:**

Train and test data using BOWs

# Dictionary Learning:

Learn Visual Words using clustering

1. extract features (e.g., SIFT) from images

# Dictionary Learning:

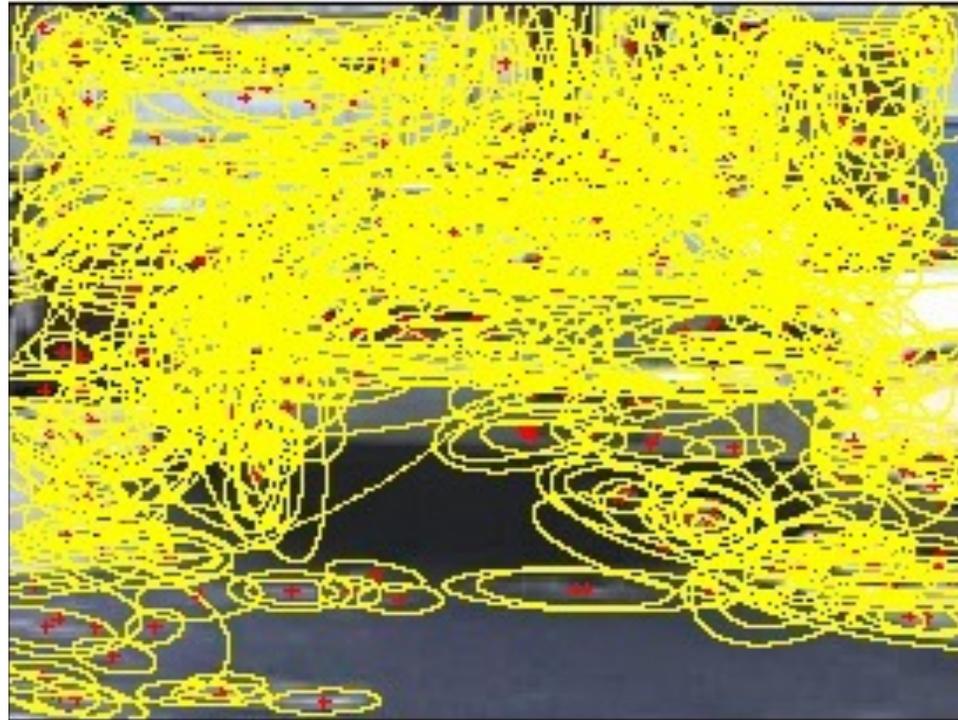

Learn Visual Words using clustering

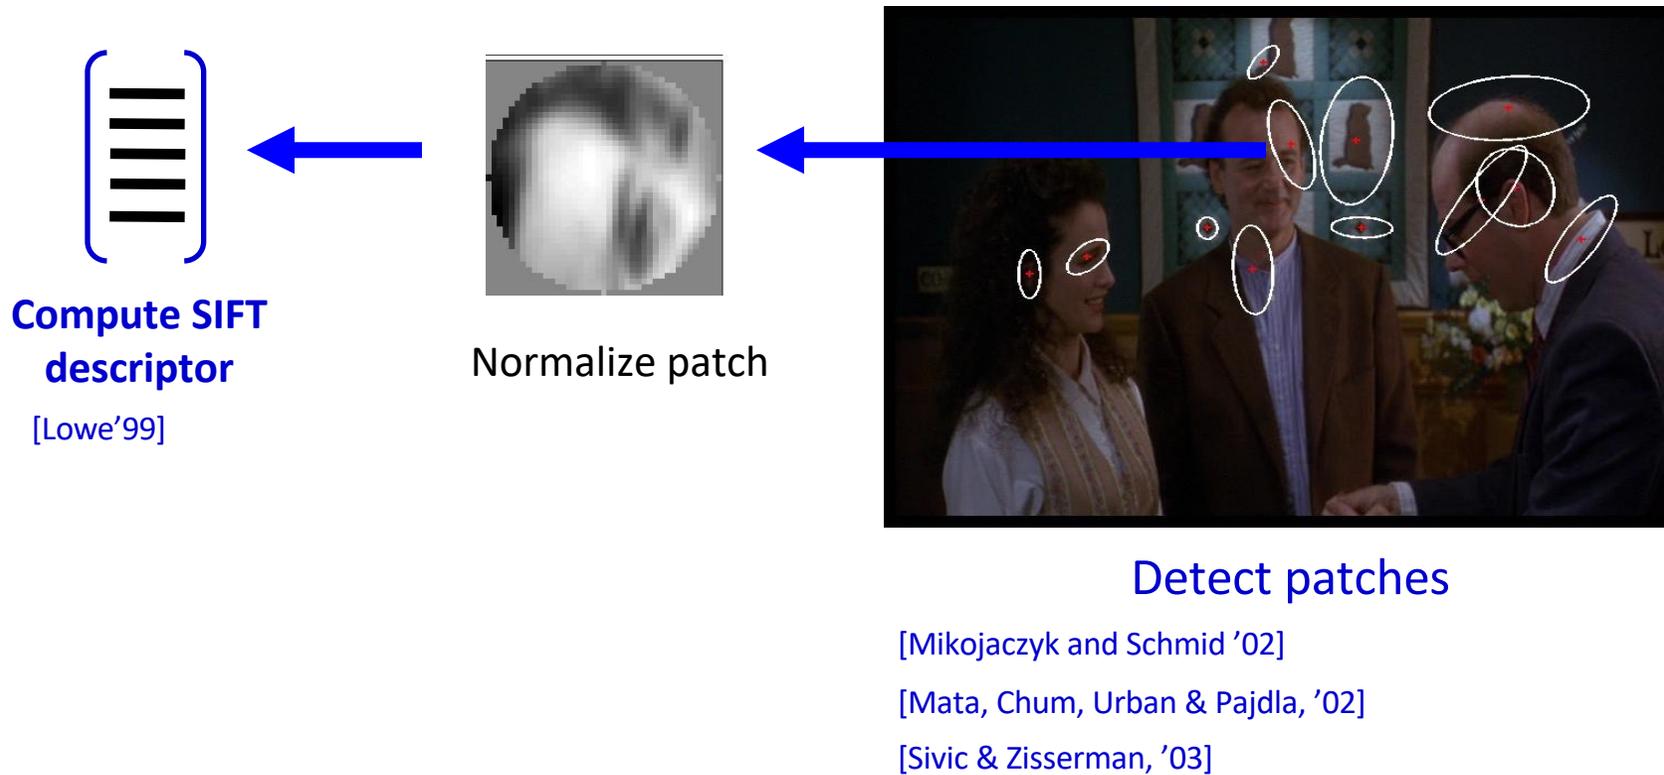

2. Learn visual dictionary (e.g., K-means clustering)

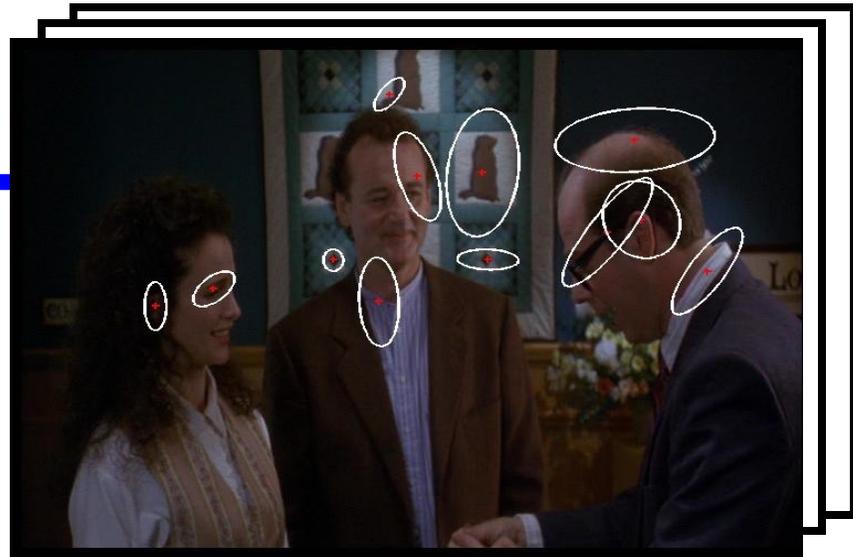

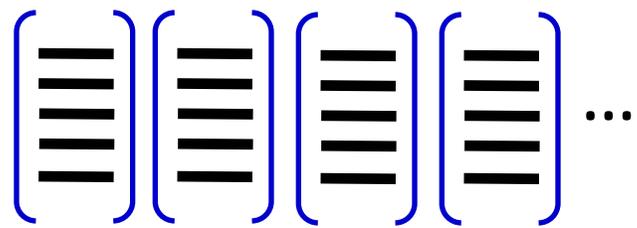

*What kinds of features can we extract?*

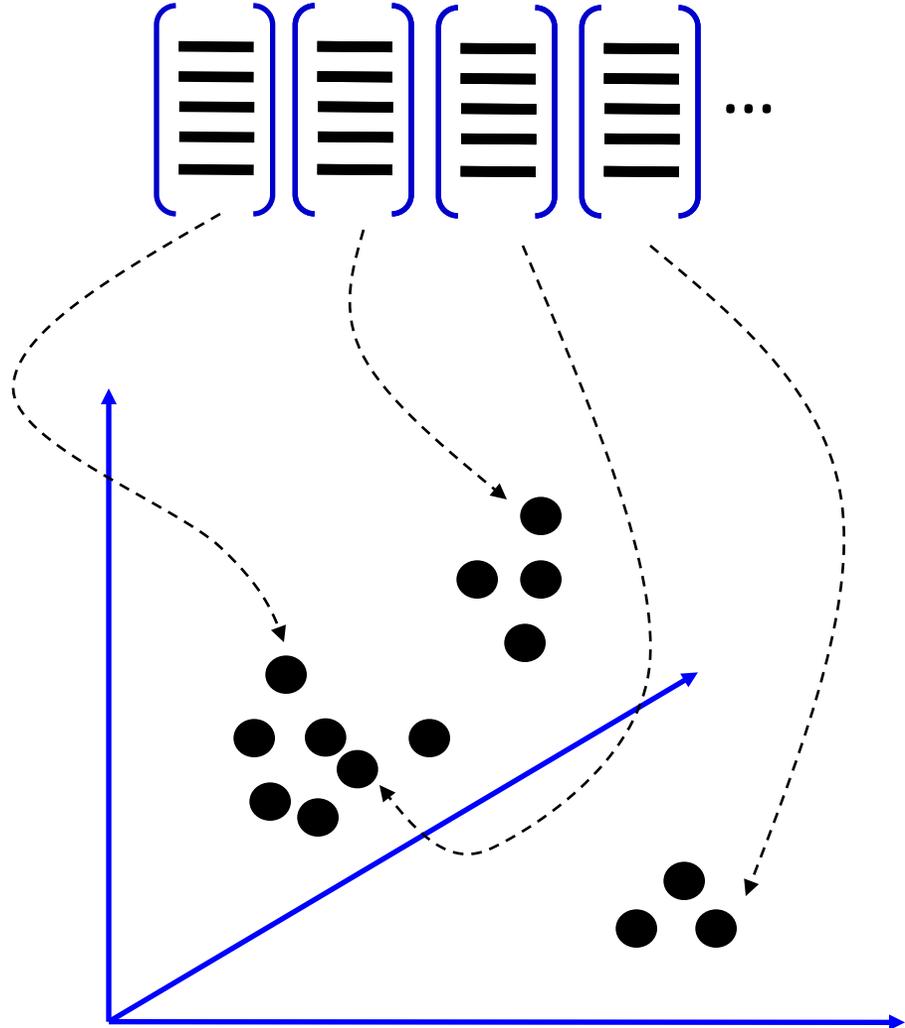

- **Regular grid**
  - Vogel & Schiele, 2003
  - Fei-Fei & Perona, 2005
- **Interest point detector**
  - Csurka et al. 2004
  - Fei-Fei & Perona, 2005
  - Sivic et al. 2005
- **Other methods**
  - Random sampling (Vidal-Naquet & Ullman, 2002)
  - Segmentation-based patches (Barnard et al. 2003)

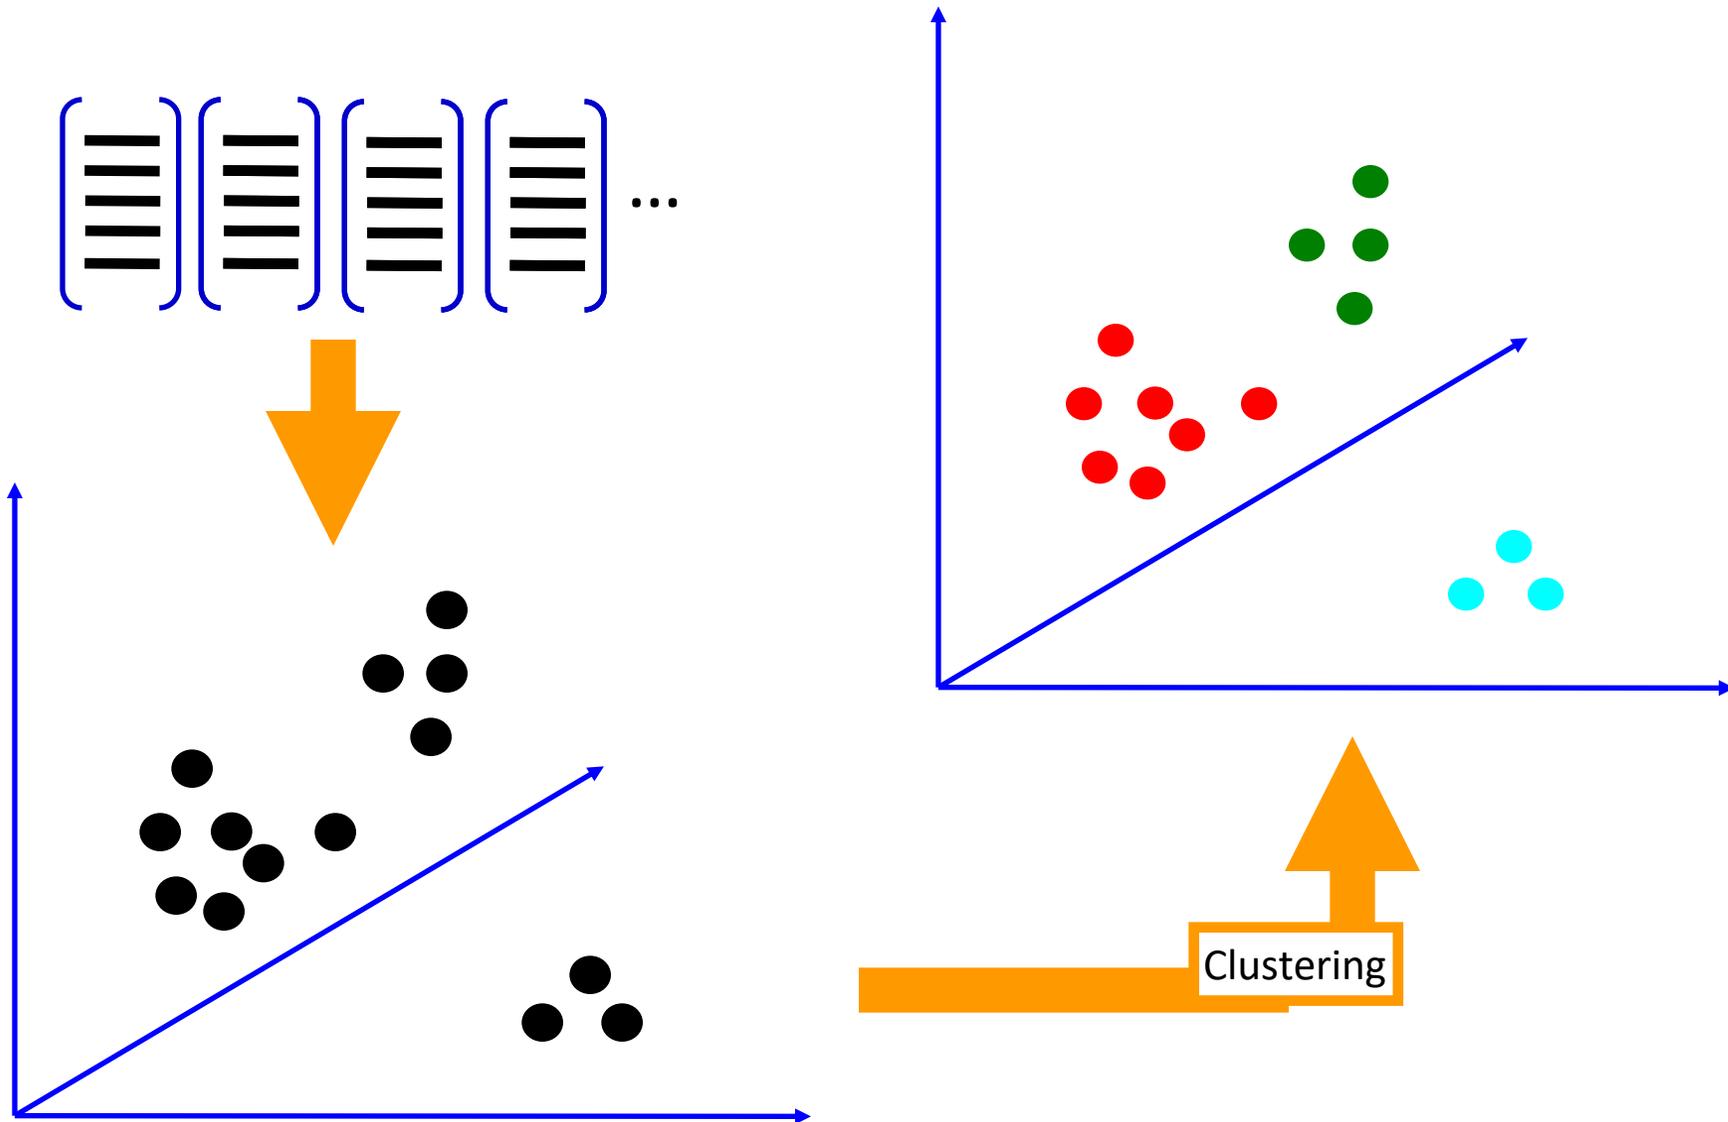

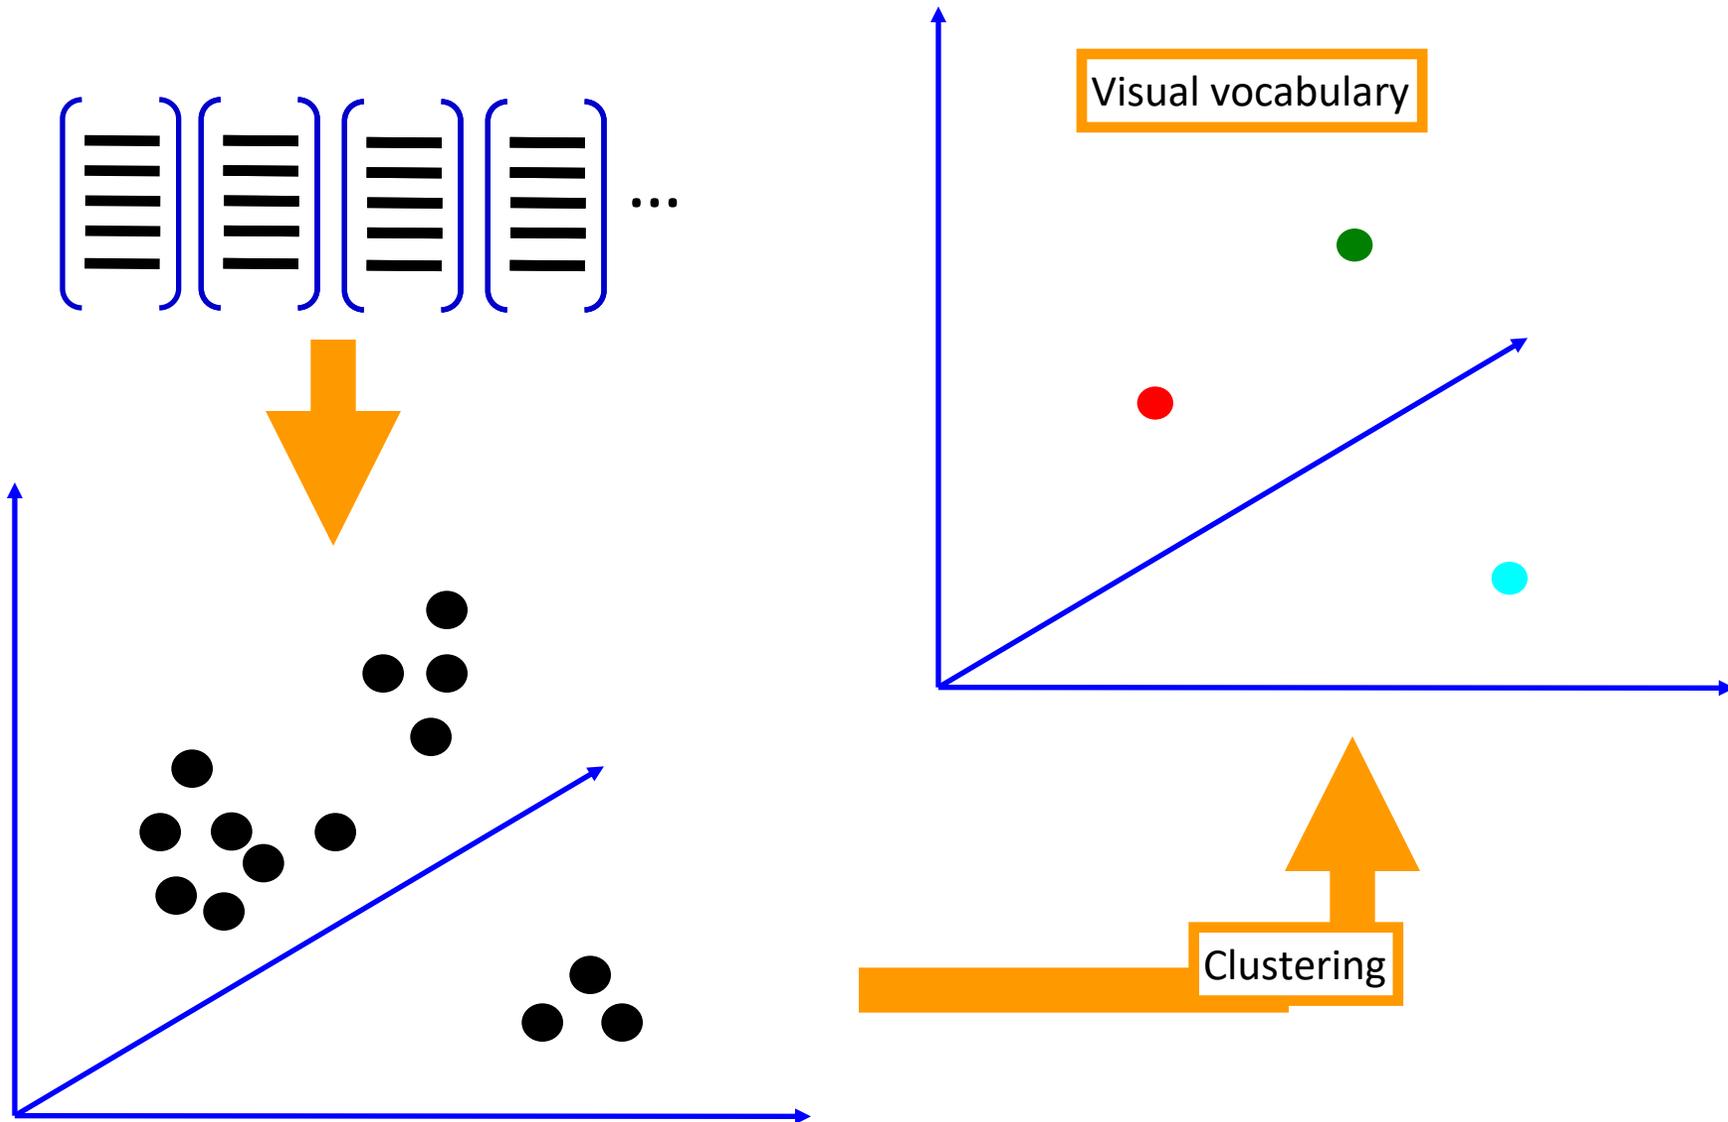

*How do we learn the dictionary?*

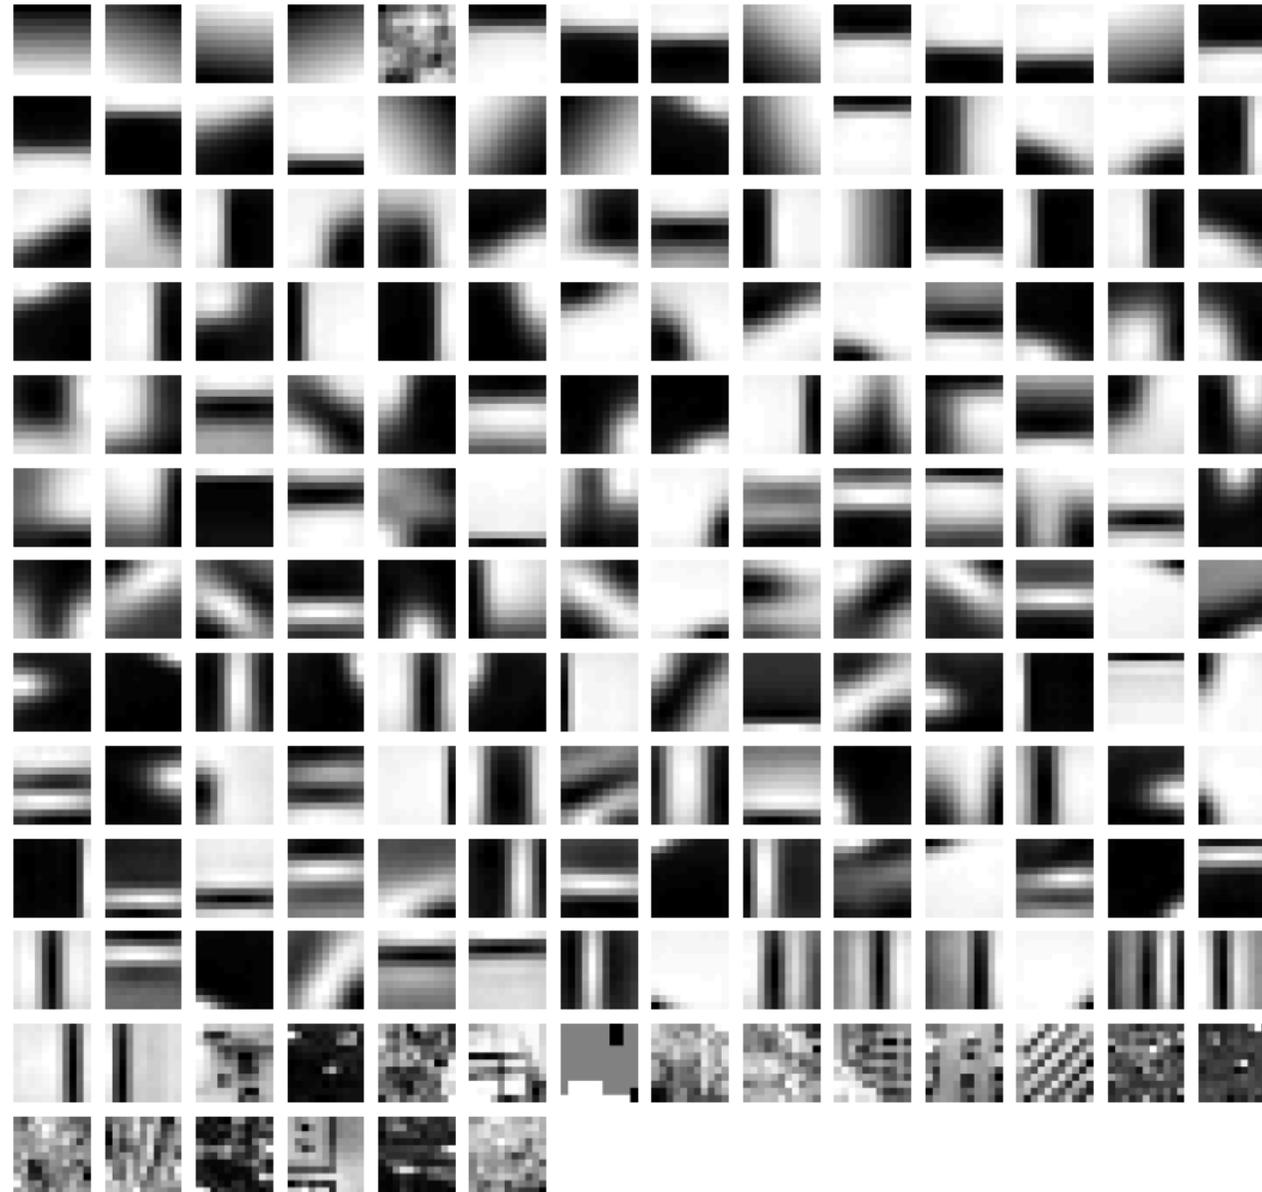

## *From what **data** should I learn the dictionary?*

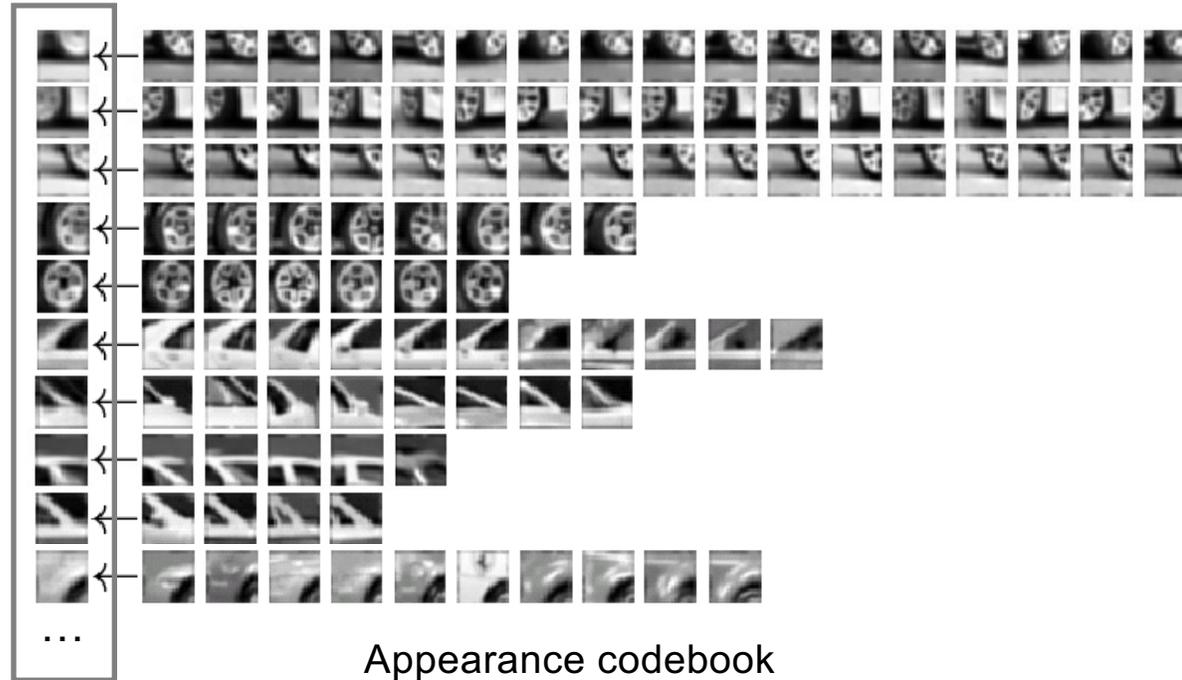

- Dictionary can be learned on separate training set
- Provided the training set is sufficiently representative, the dictionary will be “universal”

# Example visual dictionary

---

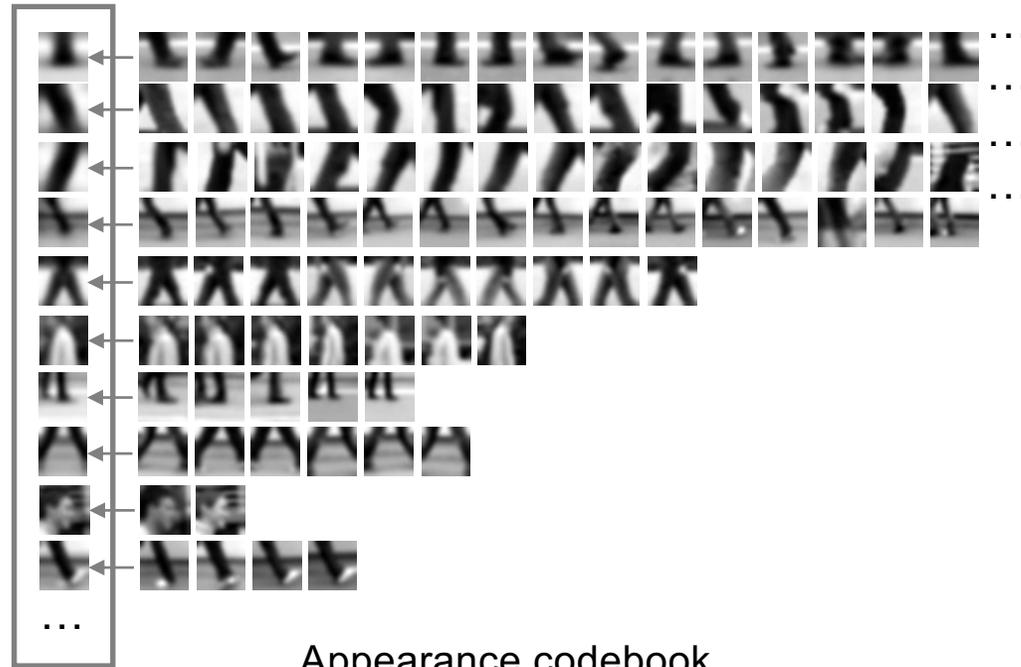

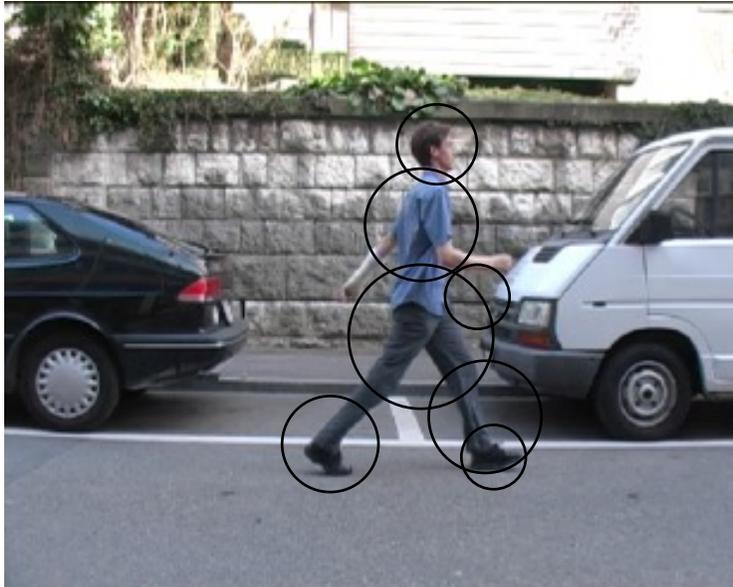

# Example dictionary

# Another dictionary

---

## **Dictionary Learning:**

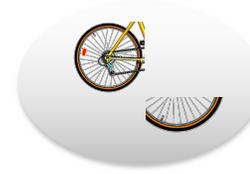

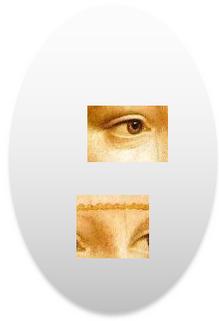

Learn Visual Words using clustering

## **Encode:**

build Bags-of-Words (BOW) vectors  
for each image

## **Classify:**

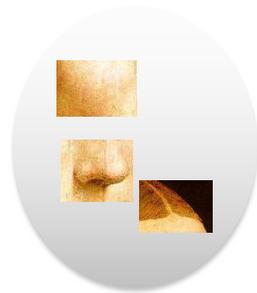

Train and test data using BOWs

1. Quantization: image features gets associated to a visual word (nearest cluster center)

### **Encode:**

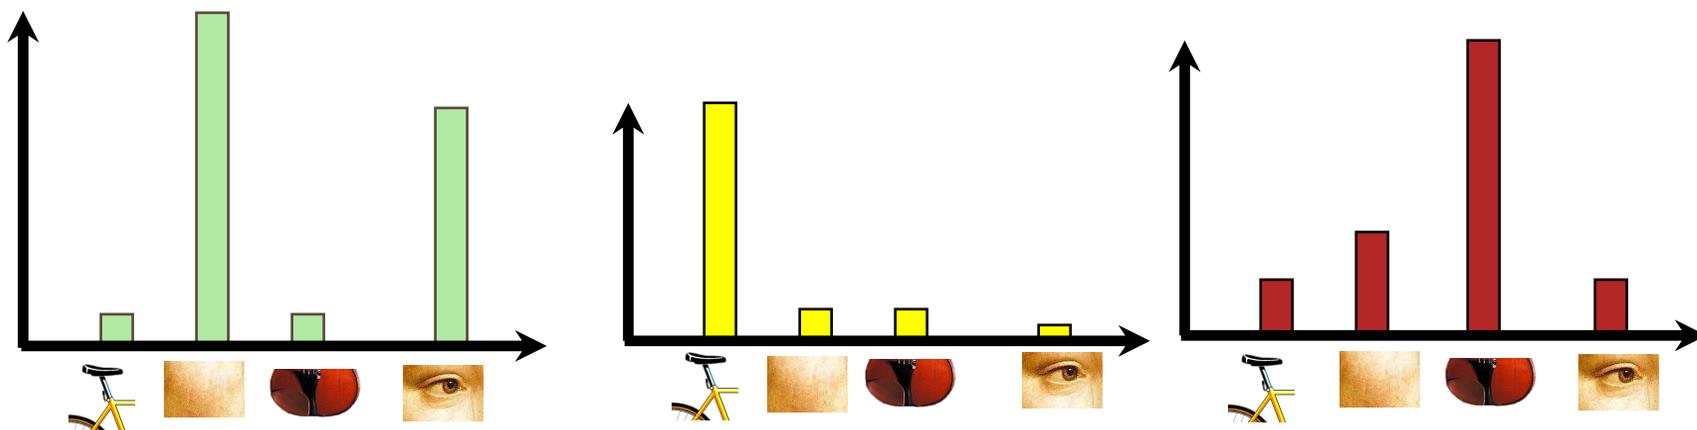

build Bags-of-Words (BOW) vectors for each image

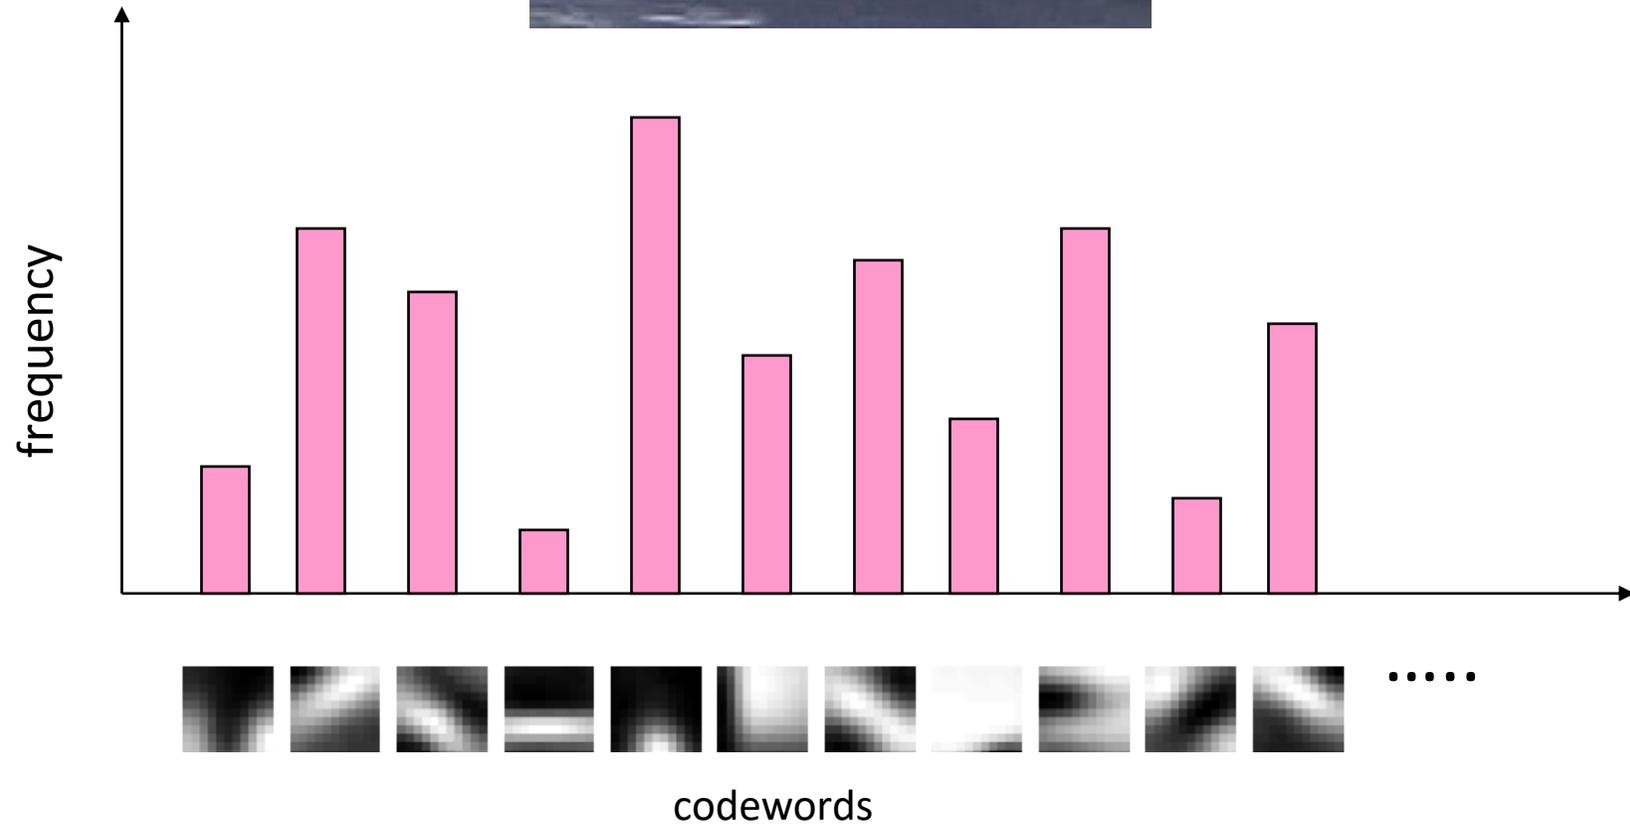

## Encode:

build Bags-of-Words (BOW) vectors  
for each image

2. Histogram: count the  
number of visual word  
occurrences

## **Dictionary Learning:**

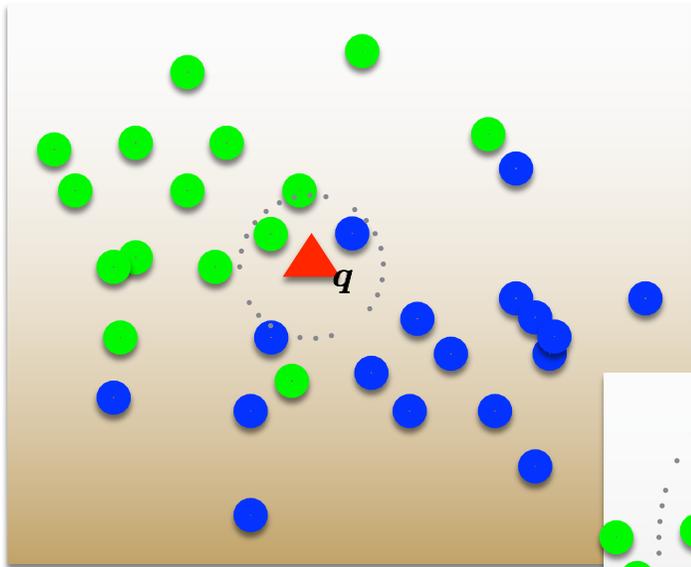

Learn Visual Words using clustering

## **Encode:**

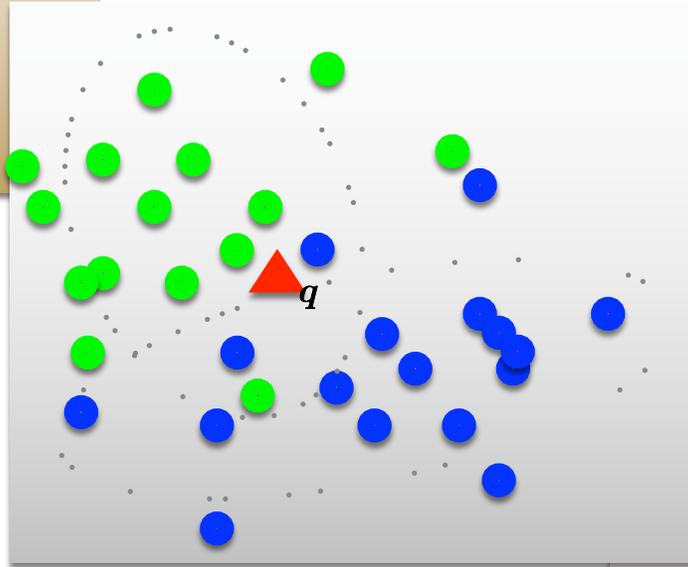

build Bags-of-Words (BOW) vectors  
for each image

## **Classify:**

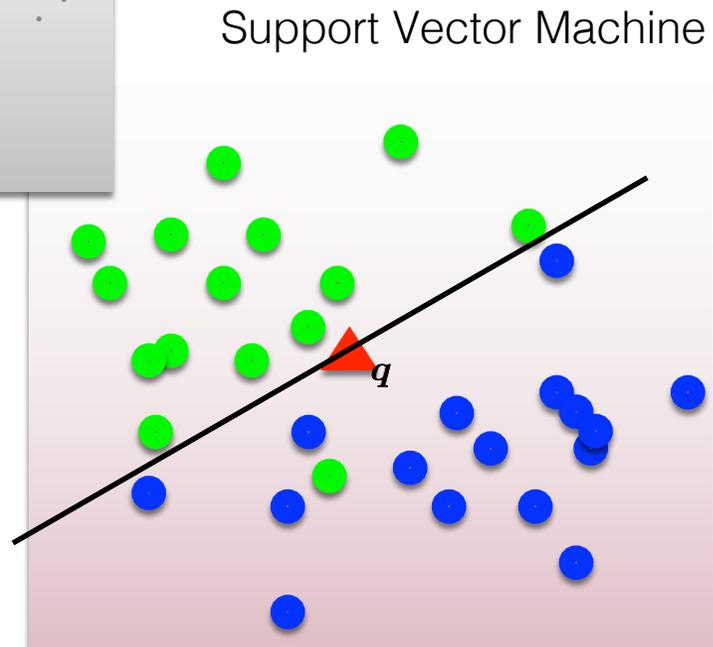

Train and test data using BOWs

K nearest neighbors
